                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S) is involved in the synthesis of beta-CPA, from cyclo-acetoacetyl-L-tryptophan and dimethylallylpyrophosphate, by its homology to a dimethylallylryptophan synthase (DMAT-S) from Claviceps purpures. Aspergillus host cells having a modification in the DCAT-S gene, leading to reduced or eliminated toxin production, are useful for expression of heterologous polypeptides of interest. Other toxins which may be reduced or eliminated comprise kojic acid, 3-nitropropionic acid, emodin, etc. The DCAT-S gene can be used to identify and disrupt similar genes in other filamentous fungal host strains such as Trichoderma, Penicillium
                                                                                                                                                                                                                             9

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FP cells and a substrate of expressed sequence tags (BST). The ESTS or are used in the methods for monitoring differential expression of genes on a first filamentous fungal (FF) cell relative to expression of the ESTS or ame genes in one or more second filamentous fungal cells. Monitoring the global expression of form FP cells allows the production potential cof the microorganisms to be improved. New genes may be discovered, of possible functions of unknown open reading frames can be identified and genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTS provides several advantages over genomic or random GDNA clones including elimination of conducts to facilitate analysis of the results. AAF01478 to AAF11247 or products to facilitate analysis of the results. AAF01478 to AAF11247 or ESTS from Aspergillus niger; AAF1184 to AAF11247 or expresents ESTS from Aspergillus oryzae; and AAF14879 represents ESTS from Aspergillus oryzae; and AAF14879 represents ESTS from Aspergillus oryzae; and AAF14879 represents ESTS from Aspergillus resear; which are all specifically claimed in the present nvention

                                                                              sequences (AES50888-AES56893), which are expressed by a fungus under specific culture conditions including one or more of eutrophic, oligorrophic, solid, early germination, alkaline, high temperature, low temperature or maltose culture or polymucleotides stringently hybridising to these sequences. The polymucleotides are useful for monitoring the progress of fermentation and the growth conditions of a fungus, especially of Aspergillus oryzae which is widely used in industrial fermentation. Also monitoring for fungul contamination. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   345

DNA encoding dimethylallyltryptophan synthase (Dmaw) version #1.

(first entry)

08-MAY-2002

ABK15520;

```
Company nucleic acid (I). (I) is a manegorate from epiphyte fungial Nectyphodium coencyhlalum symbiont of commercially significant grasses and suseful for expressing Dmaw in a cell by recombinant techniques.

(I) is also useful for identifying endophytes e.g. from commercial plants used in forage, pasture, turf, land reclamation and soil conservation that contrain or lack a Dmaw gene and producing increased amount of ergot alkaloids involving expressing (I) in a host fungal cell containt the copy number of mRNA derived from transcription of the nucleic acid molecule is increased, allowing the host fungal cell to grow under appropriate growth conditions, thus causing increased production of ergot alkaloid. Probes derived from (I) are useful for identifying Nectyphodium or Epichloe that lack Dmaw and therefore are unlikely to produce ergot alkaloids. The primers are useful for amplifying segments of Dmaw from fungi in family Clavicipitaceae. (I) is also useful for identifying related sequences such as from Balansia, Balansiapsis, C Echinodothis, Atkinsonella, Myriogenospora, Neotyphodium, and Parepichloe, or natural or induced mutants. A knockout construct of (I) the mail of the engineer in ergot alkaloid-deficient for a mail and the construct of the engineer and engineer are uniqued mitains and provide and engineer and prockout construct of (I) the mail of the engineer and procked afficient for a mail and the engineer and procked afficient for a mail and the engineer and engin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid encoding dimethylallyltryptophan synthase (DmaW molecule) from fungi that are symbionts of commercially important grasses, useful to engineer ergot alkaloid-deficient symbionts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        152

and is useful for expressing DmaW in a cell by recombinant techniques.

(I) is also useful for: identifying endophytes e.g. from commercial

CC plants used in forage, pasture, turf, land reclamation and soil

CC conservation that contain or lack a DmaW gene and producing increased

amount of ergot alkaloids involving expressing (I) in a host fungal cell

CC acid molecule is increased, allowing the host fungal cell to grow under

appropriate growth conditions, thus causing increased production of ergot

alkaloid. Probes derived from (I) are useful for identifying Neotyphodium

CC alkaloid. Probes derived from (I) are useful for amplifying segments

CC produce ergot alkaloids. The primers are useful for amplifying segments

CC produce ergot alkaloids. The primers are useful for amplifying segments

CC formaw from fungi in family Clavicipitaceae. (I) is also useful for

identifying related sequences such as from Balansia, Balansiopsis,

CECHINOGOTHIS, Atkinsonella, Myriogenospora, Neotyphodium, and

CC Parepicatione, or natural or induced mutants. A knockout construct of (I)

C Parepicatione, or natural or induced mutants. A knockout construct of useful for engineering ergot alkaloid-deficient

C fungal symbionts (endophytes of plants). This sequence encodes a

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTs are used in the methods for monitoring differential expression of genes in one or more second filamentous fungal cells. Monitoring the same genes in one or more second filamentous fungal cells. Monitoring the of the microorganisms to be improved. New genes may be discovered, possible functions of unknown open reading frames can be identified and of genes can be used to study how FF cells adapt to changes in culture companions. environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTs provides several advantages over genomic or random CDNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, products to facilitate analysis of the results. AAF01748 to AAF11247 represents ESTS from Aspergillus niger; AAF11878 represents ESTS from ASPERGING invantion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          111

2002-163205/21. P-PSDB; AAU76412 New isolated nucleic acid encoding dimethylallyltryptophan synthase molecule) from fungi that are symbionts of commercially important grasses, useful to engineer ergot alkaloid-deficient symbionts.

Disclosure, Col 17-20; 16pp; English.

The invention describes an isolated dimethylallyltryptophan synthase (dmaw) nucleic acid (I). (I) is a Dmaw sequence from epiphyte fungi Neotyphodium coenophialum symbiont of commercially significant grasses and is useful for expressing Dmaw in a cell by recombinant techniques. (I) is also useful for: identifying endophytes e.g. from commercial plants used in forage, pasture, turf, land recolamation and soil conservation that contain or lack a Dmaw gene and producing increased amount of ergot alkaloids involving expressing (I) in a host fungal cell so that the copy number of many derived from transcription of the nucleic appropriate growth conditions, thus causing increased production of ergot alkaloid. Probe derived from (I) are useful for identifying Neotyphodium or Epichloe that lack Dmaw and therefore are unlikely to produce ergot alkaloids. The primers are useful for amplifying sequents of dentifying in family Clavicipitaceae. (I) is also useful for identifying related sequences such as from Balansio, and parently in family Clavicipitaceae. (I) is also useful for cuntisense construct is useful for engineering ergot alkaloid-deficient fungal symbionts (endophytes of plants). This sequence encodes a construct is useful for engineering ergot alkaloid-deficient fungal symbionts (endophytes of plants). This sequence encodes a dimentifying the plants). This sequence encodes a dimentifying the plants of the method of the Invention

The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in a first filamentous fungal (FF) cells. The method uses fluorescence-labeled nucleic acids isolated from cells. The method uses fluorescence-labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (BST). The BSTs care used in the methods for monitoring differential expression of genes from expression of genes can a first filamentous fungal (FF) cell relative to expression of the same genes in one or more second filamentous fungal cells. Monitoring the comparison of more second filamentous fungal cells. Monitoring the comparison of the microoxganisms to be improved. New genes may be discovered. Of the microoxganisms to be improved. New genes may be discovered. Of the microoxganisms to be improved. New genes may be discovered. Or open copy number variation and stability can be monitored. The expression of genes can be used to study how FF cells adapt to changes in culture conditions, environmental stress, spore morphogenesis, recombination, advantages over genomic or random ODNA clones including elimination of redundancy as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene conducts to facilitate analysis of the results. The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly altered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant
